

Grevillea psyllid (*Acizzia* sp. near *hakeae*)

- ❑ Widespread in southern CA; probably introduced from Australia.
- ❑ Hosts: *Grevillea banksii*; still unknown if it will cross over to other genera of the same family (Proteaceae), *i.e.* to *Macademia* or *Leucadendron*.
- ❑ Field ID: Undescribed species, similar in appearance to *Acacia* psyllid but *Grevillea* psyllid not found on acacia. All stages (eggs, larvae, adults) found among leaflets of abnormal growth. Adult 3 mm long, slender, pale brown with areas of orange and yellow, and **spotted wings**. Larva yellow and free-living.
